

Design

Main

#Initialize variables (tirePrice=140 installPrice=5, numTires,TireCost,installCost,totalCost=0)

#Display welcome message

#Prompt the user for number of tires

#Get the user response

#Calculate the cost of tires (number of tires * tirePrice)

#Calculate the cost of installation (number of tires * installPrice)

#Calculate the total cost of purchase (sum of costs of tires and cost of installation)

#Display the results(totalCost)

End

Test Plan/Report

Test #	Input(no.tires)	Expected Output	Actual Output	P/F
1	2	The cost of your purchase is \$290	290	Pass
2	4	The cost of your purchase is \$580	580	Pass
3	8	The cost of your purchase is \$1160	1160	Pass
4	-1	*** Invalid Input ***	-145	Fail

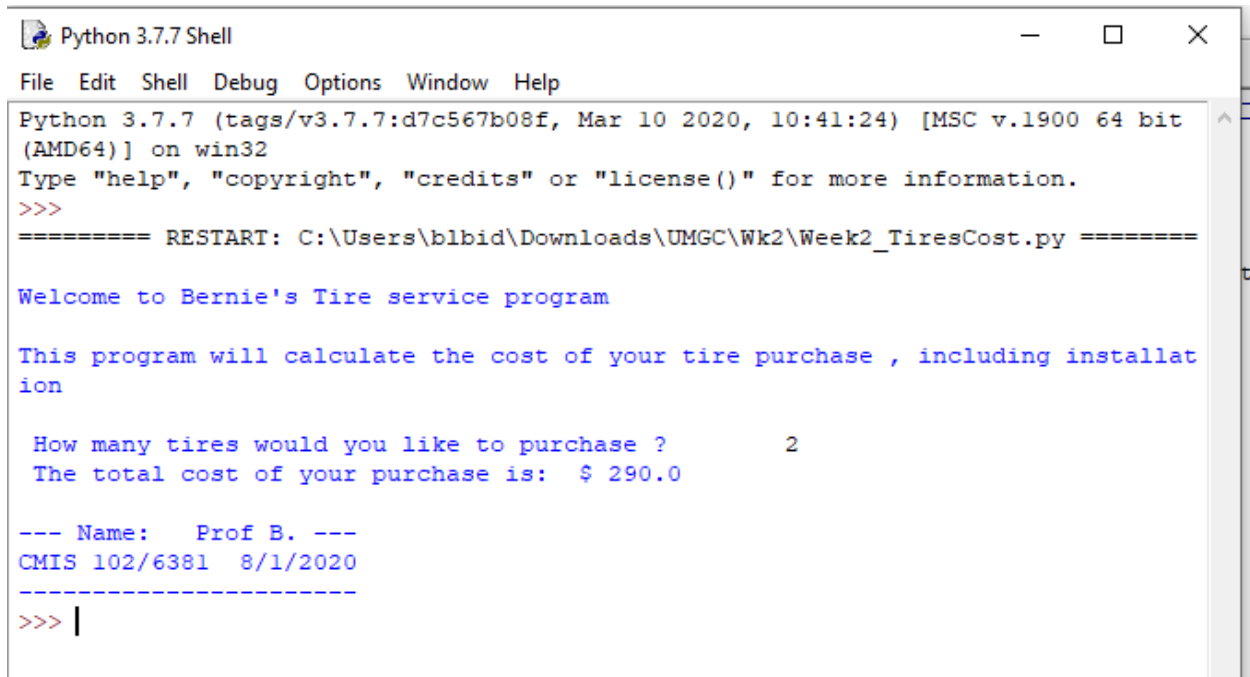

Optional (include calculaton)

Test # Calculation

1	2*140 = 280 (tireCost)	
	2*5 = 10 (installCost)	280+10 = 290 (totalCost)
2	4*140 = 560 (tireCost)	
	4*5 = 20 (installCost)	560+20 = 580 (totalCost)
3	8*140 = 1120 (tireCost)	
	8*5 = 40 (installCost)	1120+40 = 1160 (totalCost)
4	-1*140 = -140 (tireCost)	
	-1*5 = -5 (installCost)	-140 + -5 = -145 (totalCost)
